DivxDecoder.dll Was Not Found: How to Fix This Error

The error message "DivxDecoder.dll Was Not Found" usually indicates that the DivX video codec is either missing or corrupted on your computer. Here are a few steps you can take to fix this error:

1. Reinstall the DivX Codec: The first thing you should do is reinstall the DivX codec. You can download the latest version of the codec from the official DivX website. Once downloaded, run the installer and follow the prompts to install the codec on your computer.
2. Update Your Media Player: If you're using a media player like Windows Media Player or VLC, make sure you have the latest version installed. Older versions of media players may not be compatible with the latest versions of the DivX codec.
3. Scan for Malware: Sometimes malware or viruses can interfere with the operation of codecs on your computer. Run a full virus scan on your computer to check for any malware or viruses that may be affecting the operation of the codec.
4. Perform a System Restore: If none of the above steps work, you can try performing a system restore to a point in time before you started experiencing this error. This will restore your computer to a previous state where the DivX codec was functioning properly.

However considering you have already purchased Restoro and would like us to assist you in doing that utilizing a remote session, please contact our support and they will be happy to help you.
